

About the project

MICAT – Multiple Impacts Calculation Tool aims to develop a comprehensive approach and user-friendly online tool to estimate the multiple impacts or multiple benefits of energy efficiency measures at three governance levels: local, national, and EU.

Data-driven decisions for smarter energy policy

This project has received funding from the European Union's Horizon 2020 research and innovation programme under grant agreement No. 101000132.

The project sets a sound empirical basis for monitoring Multiple Impacts through a publicly available online tool (MICATool), which is being co-created with a broad range of stakeholders from each governance level.

The MICATool will enable simplified analyses to be carried out on the basis of different data and policy scenarios, in order to compare and assess the relevance of the multiple impacts.

Multilevel engagement

Reducing energy demand is at the core of many local sustainability and climate mitigation strategies.

The MICAT project is working with the EU, three EU Member States (Germany, Poland and Italy) and three local

municipalities to co-develop and explore the Tool's efficacy in the context of their sustainability, energy efficiency, and/or climate action planning processes:

- Vitoria-Gasteiz, Spain
- Calviá, Mallorca, Spain
- Tartu, Estonia
